

Sequences and Series

4

LEARNING OBJECTIVES

In this chapter, you learn how to use GC to

- ➔ Find the n th term of a Sequence.
- ➔ Find the Sum of a Sequence.
- ➔ Find the Sum to Infinity of a GP.
- ➔ Solve Quadratic Equation under EQUA mode.
- ➔ Evaluate Σ .
- ➔ Find the Root(s) of an Equation under GRAPH mode.
- ➔ Determine the Behaviour of a Sequence.

Example 4.1

A geometric series has common ratio r , and an arithmetic series has first term a and common difference d , where a and d are non-zero. The first three terms of the geometric series are equal to the first, sixth and tenth terms respectively of the arithmetic series.

- (i) Show that $5r^2 - 9r + 4 = 0$.
- (ii) Deduce that the geometric series is convergent and find, in terms of a , the sum to infinity.
- (iii) The sum of the first n terms of the geometric series is denoted by S . Given that $a > 0$, find the least value of n for which S exceeds 99% of the sum to infinity.

SOLUTION

$$(i) \quad r = \frac{a + (6-1)d}{a} = \frac{a + (10-1)d}{a + (6-1)d}$$

$$r = 1 + 5 \left(\frac{d}{a} \right) = \frac{1 + 9 \left(\frac{d}{a} \right)}{1 + 5 \left(\frac{d}{a} \right)}$$

$$\therefore \frac{d}{a} = \frac{r-1}{5} \Rightarrow r = \frac{1 + 9 \left(\frac{r-1}{5} \right)}{1 + 5 \left(\frac{r-1}{5} \right)} \Rightarrow r^2 = 1 + 9 \left(\frac{r-1}{5} \right) \Rightarrow 5r^2 = 5 + 9r - 9$$

$$\Rightarrow 5r^2 - 9r + 4 = 0 \text{ (shown)}$$

$$(ii) \quad 5r^2 - 9r + 4 = 0 \Rightarrow (r-1)(5r-4) = 0 \Rightarrow r = 1 \text{ or } r = \frac{4}{5}$$

Since $d \neq 0$, the three terms of GP are not the same, thus $r \neq 1$.

Hence, $r = \frac{4}{5} \Rightarrow$ Since $|r| < 1$, the geometric series is convergent.

$$\text{And the sum to infinity} = \frac{a}{1 - \frac{4}{5}} = 5a.$$

$$(iii) \quad S_n > 0.99S_\infty$$

$$\frac{a(1-0.8^n)}{1-0.8} > 0.99 \frac{a}{1-0.8}$$

$$1 - 0.8^n > 0.99$$

$$0.8^n < 0.01$$

$$n \lg 0.8 < \lg 0.01$$

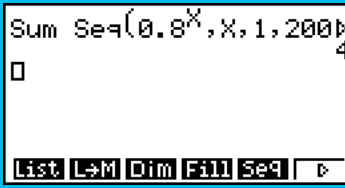

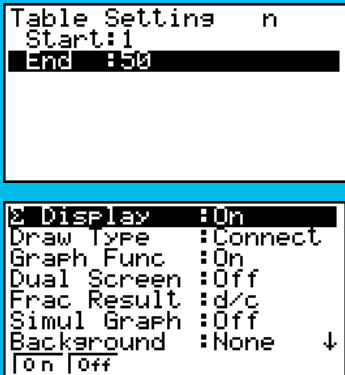

$$n > \frac{\lg 0.01}{\lg 0.8}$$

$$n > 20.6$$

Hence, the least value of n is 21.

(You may use GC to verify your answer.)

FORM DEL

21

Select **TABL**.

Press ▼ until $\sum a_n$ exceeds $0.99S_\infty$, i.e. $0.99 \times 4 = 3.96$.

You may also consider 0.8^n falling below 0.01.

Both approaches arrive at the same answer: the least value of n is 21.

Example 4.2

- (i) Patrick saves \$20 on 1 January 2008. On the first day of each subsequent month he saves \$4 more than in the previous month, so that he saves \$24 on 1 February 2008, \$28 on 1 March 2009, and so on. On what date will he first have saved over \$5000 in total?
- (ii) Kenny puts \$20 on 1 January 2008 into a bank account which pays compound interest at a rate of 3% per month on the last day of each month. He puts a further \$20 into the account on the first day of each subsequent month.
- How much compound interest has his original \$20 earned at the end of 3 years?
 - How much in total, correct to the nearest dollar, is in the account at the end of 3 years?
 - After how many complete months will the total in the account first exceed \$5000?

SOLUTION

(i) $T_1 = 20, d = 4$

$$\frac{n}{2}[2(20) + 4(n-1)] > 5000 \Rightarrow n^2 + 9n - 2500 > 0 \Rightarrow n < -54.7 \text{ or } n > 45.7$$

\therefore Hence, Patrick will first have saved over \$5000 in total on 1 October 2011.

FORM DEL WEE G·CON G·FLT

Keep pressing ▼ until the value on the right column first reaches 5000 or above.

Record the corresponding value on the right column: 72.

Example 4.3

A sequence u_1, u_2, u_3, \dots is such that $u_1 = 1$ and

$$u_{n+1} = u_n - \frac{3n^2 + 3n + 1}{n^3(n+1)^3}, \text{ for all } n \geq 1.$$

(i) Use the method of mathematical induction to prove that $u_n = \frac{1}{n^3}$.

(ii) Hence find $\sum_{n=1}^N \frac{3n^2 + 3n + 1}{n^3(n+1)^3}$.

(iii) Give a reason why the series in part (ii) is convergent and state the sum to infinity.

(iv) Use your answer to part (ii) to find $\sum_{n=2}^N \frac{3n^2 - 3n + 1}{n^3(n-1)^3}$.

SOLUTION

- (i) Let P_n be the statement $u_n = \frac{1}{n^3}$ where $u_{n+1} = u_n - \frac{3n^2 + 3n + 1}{n^3(n+1)^3}$ and $u_1 = 1$ for $n \in \mathbb{Z}^+$.

$$\text{When } n=1, \text{ L.H.S.} = u_1 = 1; \text{ R.H.S.} = \frac{1}{1^2} = 1.$$

\therefore L.H.S. = R.H.S.

$\therefore P_1$ is true.

Assume P_k is true for some $k \in \mathbb{Z}^+$, i.e. $u_k = \frac{1}{k^3}$.

To prove P_{k+1} is true, i.e. $u_{k+1} = \frac{1}{(k+1)^3}$

$$\begin{aligned} \text{L.H.S.} = u_{k+1} &= u_k - \frac{3k^2 + 3k + 1}{k^3(k+1)^3} \\ &= \frac{1}{k^3} - \frac{3k^2 + 3k + 1}{k^3(k+1)^3} \\ &= \frac{(k+1)^3 - 3k^2 - 3k - 1}{k^3(k+1)^3} \\ &= \frac{k^3 + 3k^2 + 3k + 1 - 3k^2 - 3k - 1}{k^3(k+1)^3} \\ &= \frac{1}{(k+1)^3} \\ &= \text{R.H.S.} \end{aligned}$$

$\therefore P_{k+1}$ is true whenever P_k is true.

Since P_1 is true and $P_k \Rightarrow P_{k+1}$ is true by Mathematical Induction,

P_n is true for all $n \in \mathbb{Z}^+$.

$$\begin{aligned} \text{(ii)} \quad \sum_{n=1}^N \frac{3n^2 + 3n + 1}{n^3(n+1)^3} &= \sum_{n=1}^N (u_n - u_{n+1}) \\ &= \begin{array}{l} u_1 - u_2 \\ + u_2 - u_3 \\ \dots \\ + u_{N-1} - u_N \\ + u_N - u_{N+1} \end{array} \\ &= u_1 - u_{N+1} \\ &= 1 - \frac{1}{(N+1)^3} \end{aligned}$$

(You may use GC to verify your answer.)

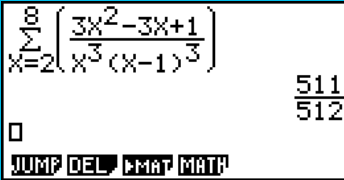

<p>MENU 1</p> <p>F4 F6 F2</p> <p>X.θ.T</p> <p>1 8</p> <p>X.θ.T</p> <p>3 X.θ.T</p> <p>3 X.θ.T</p> <p>1 X.θ.T</p> <p>3 cos</p> <p>1 tan</p> <p>3 EXE</p>		<p>Select RUN.MAT mode.</p> <p>Select MATH, Σ(.</p> <p>Enter the initial value "1" and the end value "8" (randomly chosen).</p> <p>Enter the expression.</p> <p>Answer: 728/729. If the answer is not in fraction form, press F-D.</p>
<p>1 - a/b 1</p> <p>9 ^ 3</p> <p>EXE</p>		<p>Evaluate the answer in part (ii) when $N = 8$.</p> <p>Answer: 728/729 <input checked="" type="checkbox"/></p>

(iii) When $N \rightarrow \infty$, $\frac{1}{(N+1)^3} \rightarrow 0 \Rightarrow 1 - \frac{1}{(N+1)^3} \rightarrow 1 \Rightarrow \sum_{n=1}^N \frac{3n^2 + 3n + 1}{n^3(n+1)^3} \rightarrow 1$

Hence, the series in part (ii) is convergent and the sum to infinity is 1.

$$\begin{aligned}
 \text{(iv)} \quad \sum_{n=2}^N \frac{3n^2 - 3n + 1}{n^3(n-1)^3} &= \sum_{r=1}^{N-1} \frac{3(r+1)^2 - 3(r+1) + 1}{(r+1)^3 r^3} \text{ when } n = r + 1 \\
 &= \sum_{r=1}^{N-1} \frac{3(r+1)^2 - 3(r+1) + 1}{r^3(r+1)^3} \\
 &= \sum_{r=1}^{N-1} \frac{3r^2 + 6r + 3 - 3r - 3 + 1}{r^3(r+1)^3} \\
 &= \sum_{r=1}^{N-1} \frac{3r^2 + 3r + 1}{r^3(r+1)^3} \\
 &= 1 - \frac{1}{(N-1+1)^3} \\
 &= 1 - \frac{1}{N^3}
 \end{aligned}$$

(You may use GC again to verify your answer.)

<p>[Apply similar keystrokes found in part (ii).]</p>		<p>Answer: 511/512</p>
		<p>Answer: 511/512 <input checked="" type="checkbox"/></p>

Example 4.4

The diagram shows the graph of $y = 2x - e^{\frac{x}{2}}$. The two roots of the equation are denoted by α and β , where $\alpha < \beta$.

- (i) Find the values of α and β , each correct to 3 decimal places.

A sequence of real numbers x_1, x_2, x_3, \dots satisfies the recurrence relation

$$x_{n+1} = \frac{1}{2} e^{\frac{x_n}{2}}$$

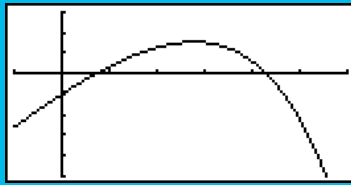

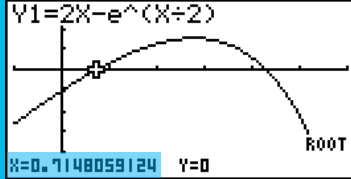

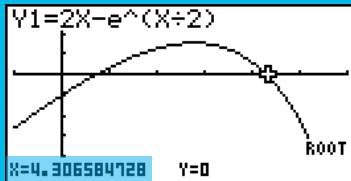

for $n \geq 1$.

- (ii) Prove algebraically that, if the sequence converges, then it converges to either α or β .
- (iii) Use a calculator to determine the behaviours of the sequence for each of the cases $x_1 = 0$, $x_1 = 3$, $x_1 = 6$.
- (iv) By considering $x_{n+1} - x_n$, prove that

$$\begin{aligned} x_{n+1} &< x_n \text{ if } \alpha < x_n < \beta, \\ x_{n+1} &> x_n \text{ if } x_n < \alpha \text{ or } x_n > \beta, \end{aligned}$$

- (v) State briefly how the results in part (iv) relate to the behaviours determined in part (iii).

SOLUTION

<p>MENU 5</p> <p>2 $X.\theta.T$ = SHIFT</p> <p>In cos $X.\theta.T$ ÷</p> <p>2 tan EXE</p>	<p>Graph Func : Y=</p> <p>Y1: 2X-e^(X+2)</p> <p>Y2: []</p> <p>Y3: []</p> <p>Y4: []</p> <p>Y5: []</p> <p>Y6: []</p> <p>[SEL] [DEL] [TYPE] [STYL] [ZMEM] [DRAW]</p>	<p>Enter GRAPH mode.</p> <p>Enter the equation of the graph as Y1.</p>
<p>F6</p>		<p>Select DRAW.</p>
<p>F5 F1</p>	<p>Y1=2X-e^(X+2)</p>  <p>X=0.7148059124 Y=0</p> <p>ROOT</p>	<p>Find the first root a.</p> <p>Answer: 0.715 🖱️</p>
<p>▶</p>	<p>Y1=2X-e^(X+2)</p>  <p>X=4.306584728 Y=0</p> <p>ROOT</p>	<p>Find the second root β.</p> <p>Answer: 4.307 🖱️</p>

(i) From GC, $\alpha = 0.715$ and $\beta = 4.307$.

(ii) $x_{n+1} = \frac{1}{2}e^{\frac{x_n}{2}}$

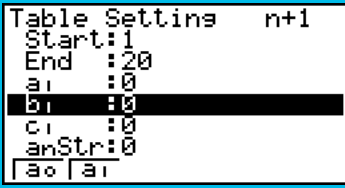

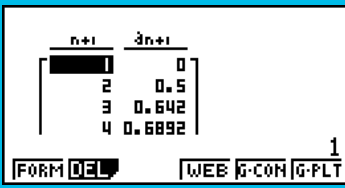

$\Rightarrow 2x_{n+1} = e^{\frac{x_n}{2}}$

$\Rightarrow 2x_{n+1} - e^{\frac{x_n}{2}} = 0$

$\Rightarrow 2L - e^{\frac{L}{2}} = 0$ given that $x_n \rightarrow L$ and $x_{n+1} \rightarrow L$ when $n \rightarrow \infty$.

Since α and β are the roots of $2x - e^{\frac{x}{2}} = 0$, hence x_n converges to α or β if the sequence converges.

(iii)
